SET-UP GUIDE · FOR YOUR PROJECT TEAM AND IT

From a GitHub link to a working jobsite gate

Granted books deliveries and checks them in at the gate. This guide shows how to set it up yourselves, what's already been done for you, and who does each remaining step.

NO APPROVED DELIVERY, NO GATE ACCESS

Try it first
working demo, nothing to install

Start here
START-HERE.md on GitHub

WHAT GRANTED DOES, IN 20 SECONDS

1 · BOOK

Contractor books

picks a day, gate and time slot for the delivery, days ahead

2 · CHECK

Rules decide

12 fixed checks approve it, reject it, or send it to a project admin

3 · PASS

QR gate pass

an approved delivery gets a pass by email and in the app

4 · GATE

Scan at the gate

green: let them in. Red: turn away, and everyone is told why

TWO WAYS TO RUN IT · PICK ONE

TRACK A — Standard for Ajax

Power Apps

Lives inside your **Microsoft 365**: SharePoint lists, Power Automate flows and a Power Apps app.

People use	the Power Apps app (phone or browser)
Outside firms	guest accounts in your Microsoft 365
Set-up team	IT + a Power Platform maker
First set-up	~1 day IT, 20-min script, then 2–3 weeks to build the app and flows
After that	about 2 days (import instead of build)

9/15 set-up items already done for you
+1 is a 15-minute paste

Best when your company already runs on Microsoft 365 and has a Power Apps maker.

TRACK B — As needed

Azure

Its own small website on your **Azure** subscription: web app, database and email, all set up by one command.

People use	any phone browser (iPhone app optional)
Outside firms	their own email and password, no Microsoft licence
Set-up team	one IT person with Azure Owner
First set-up	about 1 hour, mostly waiting
Before go-live	about ½ day of polish

5/9 set-up items already done for you
the rest are accounts only you can own

Best when you want it running this week, or have many outside subcontractors.

THE HONEST BREAKDOWN

How much is already done for you?

Everything that could be built ahead of time is already in GitHub. Here's what's left, and how long it takes.

● **Done for you** · in GitHub or made by a script ● **Quick step** · minutes ● **Your team** · your accounts, decisions or building

TRACK A · POWER APPS

9 of 15 done for you

Rules, wording, reason codes; 55 tests	in GitHub
SharePoint site + guest sharing	script
18 lists, 2 libraries, columns, colours	script
Owners-only permissions; locked secrets	script
Reason codes, settings, sample project	script
QR workbook uploaded	script
Admin code stored as a hash	script
Welcome page for guests	script
"Granted Users" group	script
Paste 2 Office Scripts	15 min
Sign-up form, app link, share app	30 min
Microsoft 365 set-up by IT	~1 day
Build 20 flows from the specs*	1–2 weeks
Build the app from the specs*	~1 week
Test, then pilot	½ day +

* Only possible inside your tenant. Export it once afterwards: every later install is a **30-minute import**.

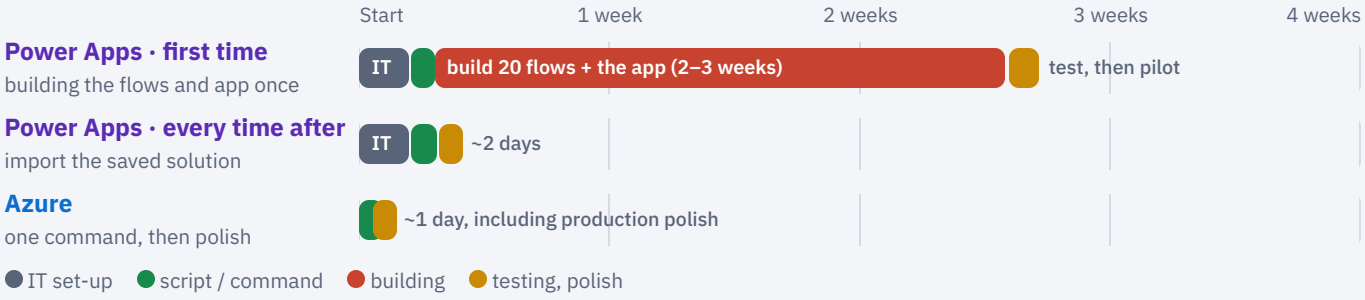

TRACK B · AZURE

5 of 9 done for you

Whole app, API, database design; 96 tests	in GitHub
All Azure resources and permissions	command
Secrets: session key, admin code hash	command
Database tables + least-privilege user	command
App installed, started and checked	command
First admin account and project	5 min
Web address, email domain, alerts	½ day
Azure subscription + Owner access	IT
iPhone app (optional; needs a Mac)	1–2 days

Why so few steps? Azure lets everything (servers, database, keys, email) be described in a file. The command reads that file and builds it, so there's nothing to click through.

How long until a working pilot?

WHO YOU'LL NEED

IT admin A B
Microsoft 365 or Azure admin rights; runs the script or command

App maker A B
builds the flows and app the first time, from the specs

Project admin A B
creates the project, approves people, reviews bookings

iPhone dev A B
only for an App Store app; needs a Mac and Apple account

TRACK A · POWER APPS

Power Apps, step by step

Five steps. A script does all of step 2. Step 4 is the big one the first time, and a 30-minute import after that.

THINK OF IT LIKE
a LEGO set. The script sorts every brick. The first time, your maker follows the booklet to build the model; after that, you just copy the finished model.

1 IT prepares Microsoft 365

IT admin · ~1 day

Making room: a separate space for Granted, an account for it to work as, and rules for outside guests.

- A Power Platform **environment** called "Granted", with a data policy (checklist: `docs/04 §6`)
- A **service account** such as `svc-granted@yourcompany.com`, with a licence and a mailbox
- Guests: one-time passcodes on, MFA for guests; decide how guests are licensed (`docs/05`)

2 Run the set-up script

SharePoint admin · 20 min

One script builds the whole filing system the app keeps its records in, and locks it so only the app can use it.

```
# PowerShell 7 on any PC (no git? GitHub → Code → Download ZIP)
> git clone https://github.com/AjaxAgents/GrantedPA
> cd GrantedPA
> pwsh ./setup/Setup-GrantedPA.ps1
```

It asks for your SharePoint name, the service account, a support email and the admin set-up code. Then it builds:

Site	18 lists	Locks	Starter data	Group + page
"Granted", guests allowed on it only	+ 2 libraries, indexes, colours	owners only; secrets for the app only	codes, settings, QR workbook, sample	Granted Users, guest Welcome page

3 Paste two Office Scripts

as the service account · 15 min

Two small helpers that draw QR codes and check the admin code. Already written and tested; they just need pasting in.

- Open `QRRunner / QR-Runner.xlsx` in Excel for the web → **Automate → New script**
- Paste `GenerateGatePassQR.ts` and `CheckAdminCode.ts` from `officescripts/`, saved under those names

4 Add the app and the flows

Power Apps maker

The app is what people tap; the flows are the behind-the-scenes workers that apply the rules and send the emails.

The first time · 2–3 weeks
Build the 20 flows (`powerautomate/`) and the app (`powerapps/`) in the order in `docs/06`; every step and formula is written out. Then **export the solution** into `solution/`.

Every time after · 30 minutes
Import the saved solution, connect it to the service account and switch the flows on:

```
pwsh ./setup/Import-GrantedPASolution.ps1
```

5 Finish, test, go live

Maker + project admin · ½ day

- Create the sign-up Microsoft Form; put the app link in `AppSettings` and on the Welcome page
- Share the app with **Granted Users**; run the scenario test in `docs/07-test-plan.md`
- Ajax staff type the **admin set-up code** as a project code to become admins, then create the project

TRACK B · AZURE

Azure, step by step

Five steps, and only one of them is technical: pasting one line into Azure's own command window. It builds everything below by itself.

THINK OF IT LIKE
a flat-pack kit that builds itself. You choose where it goes and press one button; about 15 minutes later it's standing and switched on.

1 Open Azure Cloud Shell

IT · Azure Owner · 2 min

A command window that runs inside your web browser, already signed in to Azure. Nothing to install.

- Go to `shell.azure.com`, sign in, and choose **Bash**
- You need **Owner** on the Azure subscription (or Contributor + User Access Administrator)

2 Paste one line, press Enter

1 command

```
$ git clone https://github.com/AjaxAgents/Granted && bash Granted/setup/azure-setup.sh
```

3 Answer four questions

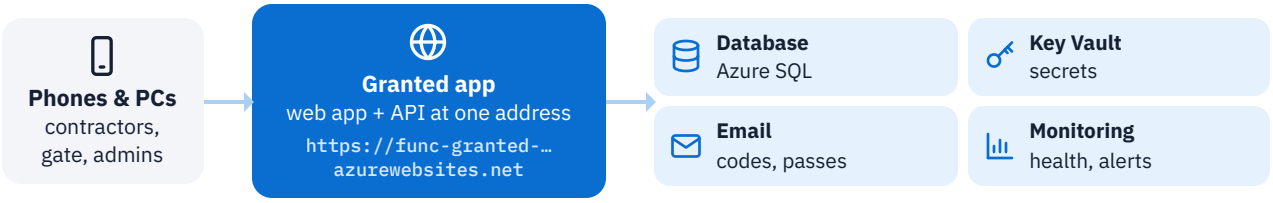

1 min

```
Resource group name [rg-granted-pilot]:       ↵
Azure region (southcentralus is Texas) [southcentralus]:  ↵
pilot or prod [pilot]:       ↵
Admin set-up code:           ••••••••   (typed twice, never shown or saved)
```

4 Wait while it builds

~15 min, automatic

It creates every piece, connects them with secure keys (no passwords anywhere), sets up the database and starts the app. Then it prints your address.

5 Become the first admin

Project admin · 5 min

- Open the address it printed → **Create account** with your company email (check junk mail for the code the first time)
- On "Join a project", type the **admin set-up code**. You can now create projects
- **New project** → share its project code with your team. They sign up and you approve them

Before production · ½ day

- [ ] Your own web address (e.g. granted.yourcompany.com)
- [ ] Your own email sender domain
- [ ] An IT group, not one person, as database admin
- [ ] Alerts in Application Insights

Updating later

Run the same line again. It keeps your data, secrets and settings, and installs the newest release. Something went wrong? Running it again is also the fix for most problems.

KEEP THIS PAGE HANDY

Before you start, and if you get stuck

Permissions checklist

WHO	TRACK A · POWER APPS	TRACK B · AZURE
IT admin	SharePoint Administrator; Application Admin (one consent); Power Platform Admin	Owner on the Azure subscription
Service account	Microsoft 365 licence with Exchange, SharePoint, Power Automate	Not needed (the app has its own managed identity)
Maker	Environment Maker in "Granted"	Not needed
Outside users	Guest account; a Power Apps licence they bring, or one you assign	Just an email address
Cost owner	Microsoft 365 and guest licences	Azure usage (SQL is the largest part)

The admin set-up code

Ajax staff with a confirmed company email type it as a project code to become **admins who can create projects**.

It is **not in GitHub and not in either app.** You type it during set-up; the script keeps only a one-way scramble (a hash), in Key Vault (Azure) or a locked list (Power Apps).

Ask the project owner for it privately, never by group email. To change it, run the set-up again and type a new one.

Passing Granted to another team? Send them the GitHub link and this PDF. Give them the code separately, by phone or in person, or let them choose their own when they run the set-up.

If something goes wrong

YOU SEE	DO THIS
Any error in a script	Run it again. Both are safe to re-run and print the fix.
Azure: region doesn't offer Flex Consumption	Run again; choose `centralus` or `eastus2`
Azure: Key Vault name in use	Use a new resource group name
Power Apps: consent prompt fails	An Application or Global Admin approves "Granted Setup (PnP)"
Guests can't open the app	Check guest sharing on the site, the Granted Users group, and their licence
No sign-up email	Check junk mail; for production, set up your own email domain

Where to read more

- **START-HERE.md**: this guide in text, with links
- **docs/06-build-guide.md**: Power Apps build, step by step
- **docs/04 · security and compliance**: for your IT review
- **docs/05 · licensing and guest access**: decide before Track A
- **Granted / docs/operations.md**: Azure set-up, updates, running it
- **docs/decision.md**: the two tracks side by side

Can't decide? Try the demo first. **Track A is the standard choice** for Ajax teams; Track B is there if you need Granted running sooner or have many outside subcontractors.
